## Alert Detail

High	Cloud Metadata Potentially Exposed

Description	<p>The Cloud Metadata Attack attempts to abuse a misconfigured NGINX server in order to access the instance metadata maintained by cloud service providers such as AWS, GCP and Azure.</p> <p>All of these providers provide metadata via an internal unroutable IP address '169.254.169.254' - this can be exposed by incorrectly configured NGINX servers and accessed by using this IP address in the Host header field.</p>
URL	<a href="https://vms.devsecops360.xyz/latest/meta-data/">https://vms.devsecops360.xyz/latest/meta-data/</a>
Method	GET
Attack	169.254.169.254
Evidence	
Other Info	Based on the successful response status code cloud metadata may have been returned in the response. Check the response data to see if any cloud metadata has been returned. The meta data returned can include information that would allow an attacker to completely compromise the system.
Instances	1
Solution	Do not trust any user data in NGINX configs. In this case it is probably the use of the \$host variable which is set from the 'Host' header and can be controlled by an attacker.
Reference	<a href="https://www.nginx.com/blog/trust-no-one-perils-of-trusting-user-input/">https://www.nginx.com/blog/trust-no-one-perils-of-trusting-user-input/</a>

Medium	<b>Absence of Anti-CSRF Tokens</b>
Description	<p>No Anti-CSRF tokens were found in a HTML submission form.</p> <p>A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request to a destination without their knowledge or intent in order to perform an action as the victim. The attack uses the application functionality using predictable URL/form actions in a repeatable way. The nature of CSRF exploits the trust that a web site has for a user. By contrast, cross-site scripting (XSS) exploits the trust a user has for a web site. Like XSS, CSRF attacks are not necessarily cross-site, but they can be. Cross-site request forgery is also known as CSRF, XSRF, one-click attack, session riding, confused deputy, and session riding.</p> <p>CSRF attacks are effective in a number of situations, including:</p> <ul style="list-style-type: none"> <li>* The victim has an active session on the target site.</li> <li>* The victim is authenticated via HTTP auth on the target site.</li> <li>* The victim is on the same local network as the target site.</li> </ul> <p>CSRF has primarily been used to perform an action against a target site using the victim's privileges. Various techniques have been discovered to disclose information by gaining access to the response. The disclosure is dramatically increased when the target site is vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operate within the bounds of the same-origin policy.</p>

Instances	5
Solution	Phase: Architecture and Design
	Use a vetted library or framework that does not allow this weakness to occur or provides constr weakness easier to avoid.
	For example, use anti-CSRF packages such as the OWASP CSRFGuard.
	Phase: Implementation
	Ensure that your application is free of cross-site scripting issues, because most CSRF defenses using attacker-controlled script.
	Phase: Architecture and Design
Solution	Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upc form. Be sure that the nonce is not predictable (CWE-330).
	Note that this can be bypassed using XSS.
	Identify especially dangerous operations. When the user performs a dangerous operation, send confirmation request to ensure that the user intended to perform that operation.
	Note that this can be bypassed using XSS.
	Use the ESAPI Session Management control.
	This control includes a component for CSRF.

Medium	CSP: style-src unsafe-inline
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate cer attacks. Including (but not limited to) Cross Site Scripting (XSS), and data injection attacks. The for everything from data theft to site defacement or distribution of malware. CSP provides a set i headers that allow website owners to declare approved sources of content that browsers should on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embedda Java applets, ActiveX, audio and video files.

Low	X-Content-Type-Options Header Missing
Description	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the body to be interpreted and displayed as a content type other than the declared content type. Current and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.

Evidence	
Other Info	This issue still applies to error type pages (401, 403, 500, etc.) as those pages are often still affected by these issues, in which case there is still concern for browsers sniffing pages away from their actual content. Below the threshold this scan rule will not alert on client or server error responses.

Instances	24
Solution	<p>Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages.</p> <p>If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application/web server to not perform MIME-sniffing.</p>

<b>Informational</b>	<b>Re-examine Cache-control Directives</b>
Description	The cache-control header has not been set properly or is missing, allowing the browser and proxy to cache content. For static assets like css, js, or image files this might be intended, however, the resource should be reviewed to ensure that no sensitive content will be cached.

Method	GET
Attack	
Evidence	no-cache
Other Info	
Instances	6
Solution	For secure content, ensure the cache-control HTTP header is set with "no-cache, no-store, must-revalidate". If the asset should be cached consider setting the directives "public, max-age, immutable".

Informational	Session Management Response Identified
---------------	--

Description	The given response has been identified as containing a session management token. The 'Other Info' field contains a set of header tokens that can be used in the Header Based Session Management Method. If the request is in a context which has a Session Management Method set to "Auto-Detect" then this rule will change the session management to use the tokens identified.
